

Identifying Patients with MCI from Healthy Controls

Patients with MCI and HC
from Sweden

Automatic Segmentation and Transcription

- Vowel Formants** (i.e., F_1 , F_2 , F_3 , F_4 , F_5) at the 15%, 50%, and 75% of the vowels' total duration: i.e., F_1 15%, F_1 50%, F_1 75%... F_5 15%, F_5 50%, and F_5 75%.
- Fundamental frequency (F_0):** mean F_0 , min F_0 , and max F_0 .
- Vowel duration**
- Gender.**
- Age**

FIGURE 2 | Network architecture. We developed 10 different networks with 21 predictors each. The networks differed in the number of hidden layers ranging from 1 ... 10. Each network architecture was evaluated twice using cross-validation and evaluation split. Model comparison measures are reported for each evaluation separately.

FIGURE 3 | Mean ROC curve and AUC of the 5-fold cross-validation. Model—M1 ... M10—are represented by solid line with a different color. The baseline is represented by a dashed gray line. All models provided ROC curves that were over the baseline. The best model is the model whose ROC curve approaches the left upper corner. The shaded area indicates the M10s SD that is the outperforming model both in terms of ROC/AUC (63%) and validation accuracy (63%).

Themistocleous Charalambos, Eckerström Marie, and Dimitrios Kokkinakis (2018). Identification of Mild Cognitive Impairment from Speech in Swedish using Deep Sequential Neural Networks. *Frontiers in Neurology*. doi: 10.3389/fneur.2018.00975.

Subtyping patients with Primary Progressive Aphasia (PPA)
