Motivation

- Speech, language, and communication disorders challenge individuals' ability to express themselves effectively and participate in social interactions, leading to social isolation, depression, and inferior quality of life.

- Impaired speech, language, and communication can be a symptom of more severe conditions, such as Alzheimer's Disease, brain tumors, stroke, and neurogenic developmental conditions.

- Thus, accurately assessing speech, language, and communication abilities is crucial for effective
  - Diagnosis,
  - Prognosis
  - Treatment/Therapy efficacy assessment.
